Sample Structure of a Quantitative Chemistry Lab Report

Below is a detailed outline of a typical lab report with sample content to illustrate each section.

1. Title

Determination of the Molarity of an Unknown Acid Using Titration

2. Abstract

This experiment aimed to determine the molarity of an unknown hydrochloric acid solution through titration with a standardized sodium hydroxide solution. The titration was performed in triplicate, and the average volume used was 25.3 mL. Calculations yielded an acid molarity of 0.100 M with a percent error of 2%. The results confirm the acid's concentration within acceptable experimental error, demonstrating the effectiveness of titration in quantitative analysis.

3. Introduction

Quantitative analysis in chemistry involves measuring the amounts of substances to understand their relationships within reactions. Acid-base titrations are common techniques for such determinations. This experiment focuses on using titration to find the molarity of an unknown HCl solution by reacting it with a known concentration of NaOH. Accurate titration relies on precise measurement and understanding of stoichiometry, emphasizing the importance of careful technique and error minimization.

4. Materials and Methods

- Standard 0.1 M NaOH solution
- Unknown HCl solution
- Burette, pipette, conical flask
- distilled water
- Phenolphthalein indicator

Procedures:

- Rinse the burette with NaOH solution and fill it, noting the initial volume.
- Using a pipette, transfer 25.0 mL of the HCl solution into the conical flask.
- Add 3 drops of phenolphthalein indicator to the acid solution.
- Slowly titrate with NaOH until a persistent light pink color appears, indicating end point.
- Record the final volume of NaOH in the burette.
- Repeat the titration three times for accuracy and calculate the average volume used.

5. Results

Trial NaOH Volume (mL) 125.42 25.23 25.3

Average titration volume: 25.3 mL

6. Calculations

Using the titration data, the molarity of HCl is calculated as follows:

- Number of moles of NaOH: $(M_{\text{NaOH}} \times V_{\text{NaOH}})$
- Since HCl and NaOH react in a 1:1 molar ratio, molarity of HCl = $\frac{\text{moles of NaOH}}{\text{volume of HCl in liters}}$

Calculation:

[

$\text{Moles NaOH} = 0.1 \text{ mol/L} \times 0.0253 \text{ L} = 2.53 \times 10^{-3} \text{ mol}$

]

[

$\text{Molarity HCl} = \frac{2.53 \times 10^{-3} \text{ mol}}{0.025 \text{ L}} = 0.101 \text{ M}$

]

Average molarity: 0.100 M (rounded)
