```
```python  

print("Hello, World!")

```
```

- Save the File:
- Name it `hello.py` or any preferred name.
- Run the Program:
- Tap the run button or select 'Run' from the menu.
- See the Output:
- Your screen should display: `Hello, World!`

Understanding the Code

- `print()` is a built-in Python function that outputs text to the console.
- The string `"Hello, World!"` is what appears on the screen.

Basic Concepts in Python for Beginners

Before progressing to more complex programs, it?s important to understand some fundamental

concepts.

Variables and Data Types

Variables store information that can be used and manipulated throughout your program.

Common Data Types:

- Integers: Whole numbers (e.g., 1, 42)
- Floats: Decimal numbers (e.g., 3.14, 0.001)
- Strings: Text data (e.g., "Python", 'Hello')
- Booleans: True or False values

Example:

```
```python
name = "Alice"

age = 25

height = 5.6

is_student = True

```
```

Operators and Expressions

Operators perform operations on variables and values:

| Operator | Description | Example |
|----------|----------------|---------|
| ----- | ----- | ----- |
| + | Addition | `a + b` |
| - | Subtraction | `a - b` |
| | Multiplication | `a b` |

| / | Division | `a / b` |

| % | Modulus | `a % b` |

Control Structures

Control flow determines the order in which code executes.

Conditional Statements:

```
```python
```

```
if age >= 18:
```

```
 print("Adult")
```

```
else:
```

```
 print("Minor")
```

```
```
```

Loops:

```
```python
```

```
for i in range(5):
```

```
 print(i)
```

```
```
```

Developing Your First Projects on a Tablet

Once familiar with basic syntax, you can start creating simple projects to reinforce your learning.

Number Guessing Game

Objective: Write a program that randomly selects a number, and the user tries to guess it.

Sample Implementation:

```
```python

import random

secret_number = random.randint(1, 100)

print("Guess the number between 1 and 100!")

while True:

 guess = int(input("Your guess: "))

 if guess == secret_number:

 print("Congratulations! You guessed it!")

 break

 elif guess

 print("Too low. Try again.")

 else:

 print("Too high. Try again.")

```
```

Note: Depending on your app, `input()` may require a different approach, such as using text input fields.

Simple Calculator

Create a program that performs basic arithmetic:

```
```python

num1 = float(input("Enter first number: "))

operator = input("Enter operator (+, -, , /): ")

num2 = float(input("Enter second number: "))
```

```
if operator == '+':

 result = num1 + num2

elif operator == '-':

 result = num1 - num2

elif operator == '*':

 result = num1 * num2

elif operator == '/':

 if num2 != 0:

 result = num1 / num2

 else:

 result = "Error: Division by zero!"

else:

 result = "Invalid operator."

print("Result:", result)

'''
```
